

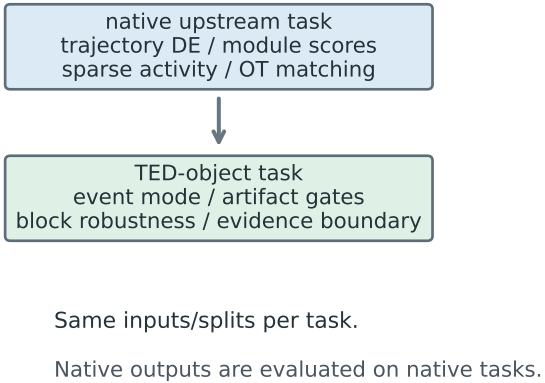

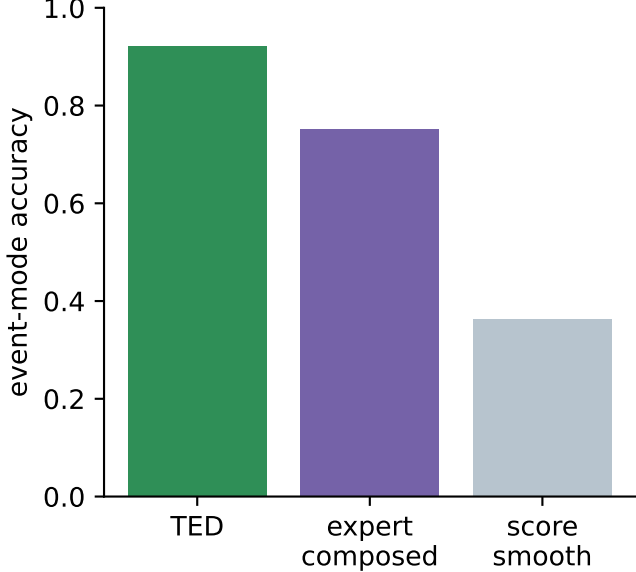

Figure 3. Same-input benchmarks separate native tasks from TED-object reporting

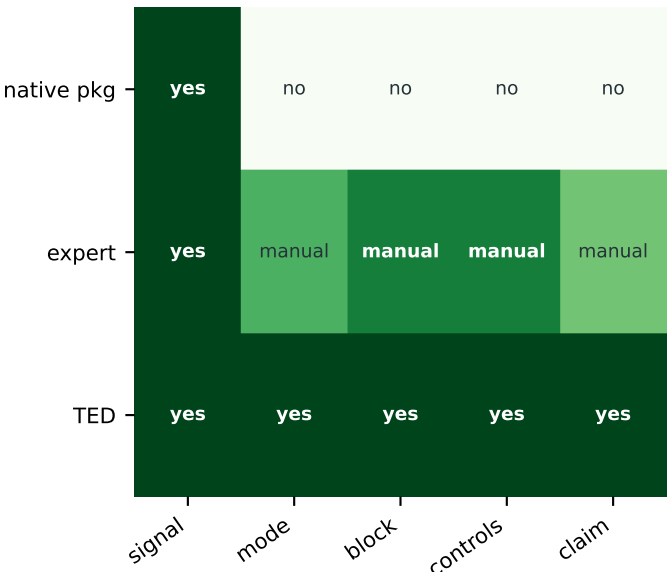

A. Two-layer benchmark framing

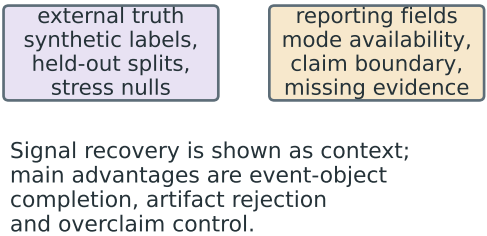

B. Strong comparator first

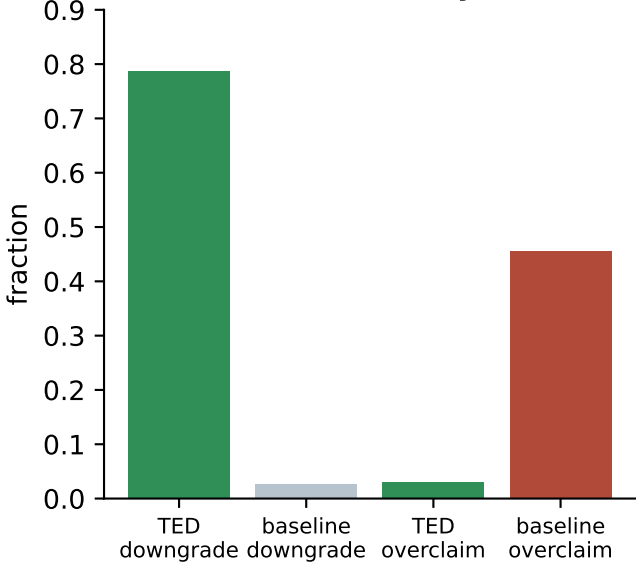

C. Event-object field coverage

D. Metrics are not circular

E. Low-identifiability behavior

F. Interpretation

TED evaluates a downstream event-object layer.

It standardizes the downstream layer that a careful analyst would otherwise assemble manually.

native output -> event object -> claim boundary

Reporting-field availability is summarized separately from biological correctness metrics.
