

TED upgrades supported event claims while blocking unsupported causal escalation

A. Boundary assignment is gate-based

Registry entries are frozen before expression-level interpretation.

B. Evidence-supported upgrades

GSE153056
outcome-supported event known source + PD-L1 protein outcome

GSE93735
reversal-supported event LPS event + dexamethasone reversal above controls

SCP1064
outcome-supported event CRISPR guide + RNA event + protein readout

C. Blocked or pending escalations

GSE271399
boundary: cross-dataset-supported event blocked: same-system full-length GATA1 rescue

SCP1064
boundary: outcome-supported event blocked: matched rescue or exhaustive perturbation-causal validation

GSE90546/GSE90063/GSE133344
boundary: not evaluable / pending blocked: methodology support claim

D. Boundary summary

Case	TED boundary	Unsupported escalation
GSE153056	outcome-supported event	universal PD-L1 causal proof
GSE93735	reversal-supported event	GSE271399 rescue validation
SCP1064	outcome-supported event	Level 4 causal rescue
GSE271399	cross-dataset-supported candidate	same-system GATA1 rescue
Pending datasets	not evaluable / pending	methodology support claim

Upgrades require outcome/reversal gates; missing rescue gates remain explicit.
